Sink Doctor

STAINLESS SINK CARE

SINK DOCTOR STAINLESS STEEL SINKS

EVERY DAY:

- Rinse the sink well after each use. Running the faucet spray for a few minutes is plenty
- Wash with mild soap and warm water, then wipe dry with a towel
- Keep standing water out of the sink. It leaves mineral buildup that dulls the finish

ONCE A WEEK:

- Scour with a non-abrasive cleanser, rubbing in the same direction as the bowl finish, back and forth or in a circular motion
- This blends small imperfections into the finish
- Rinse thoroughly and wipe dry

STAINS & SCRATCHES:

- Stubborn stains: scrub gently with the grain using a mild, non-abrasive cleanser such as Soft Scrub
- Light scratches: work them out with a Scotch-Brite pad and cleaning agent, moving with the grain
- Always rinse well afterward and wipe dry

HARD WATER & MINERALS:

- Wipe with a mild solution of white vinegar and water
- Flush with clean water, then wipe dry

GOOD TO KNOW:

- Rinsing is the most important part of sink care. A sink that is rinsed after every use keeps its original bright finish
- Always scrub in the direction of the grain, never across it

PLEASE AVOID:

- Bleach and chlorine cleaners left on the surface
- Steel wool, which leaves particles that rust
- Leaving wet sponges, cans or cast iron in the sink
